

Tailored process automation on an industrial foundation.

Custom AI solutions for mid-sized companies — on our proven, production-grade framework.

MOTIVATION

Why we are extending the offering.

In the sales process for our process-automation agents **Oskar** and **Petra**, we see a clear pattern: as AI models become more capable, customer expectations shift toward **individual solutions tailored to their specific processes** — beyond standardized products.

Mid-sized companies today are perfectly capable of building initial proof-of-concepts on their own. Development is remarkably fast thanks to modern AI tools.

What's regularly missing in the mid-market, however, is the ability to turn a working PoC into a **productive, broadly usable operation** — sustainably.

What's missing:

- **Operations know-how and experience** in safely running AI solutions
- **Time and personnel resources** for operations, monitoring and continuous development
- **Methodology and standards** that keep pace with rapid AI evolution
- **Experience in deep integration** into existing ERP, CRM and PIM landscapes

A PoC shows feasibility. Production shows impact. Between the two lies the work we take on.

FOUNDATIONS

Why aikyma.ai.

We're not talking about a concept, but about a **production-grade infrastructure**. Our offering stands on three pillars — all already in use with paying customers.

1 · Agents in production

With **Oskar** (order intake) and **Petra** (product data), we are successfully operating specialized AI agents in the DACH region today — including at **Jauch and Medidor**. That's the real-world proof that our technology and methodology work.

2 · Framework in use with partners

Our AI framework for process optimization is already available to **partners today** who use it as the basis to build their own solutions for their customers. From day one it was designed to include every element needed for the broad production operation of AI solutions.

3 · Proven team experience

Our team brings demonstrated experience in exactly the areas that make the difference between PoC and production:

- **Integration into existing IT landscapes** — deep, production-proven connectivity to ERP (Business Central, SAP, industry-specific ERPs), CRM and PIM. Data flows bidirectionally, not just as export files
- **AI-driven process automation** in operational back-office processes — from inbox to target systems
- **Organizational adaptation** of existing teams to optimized processes
- **Building and operating** AI-based infrastructure
- **Operating broadly adopted** AI processes in daily business
- **Proven, incremental project methodology** — bottom-up, not top-down

FRAMEWORK CAPABILITIES

What our framework delivers.

The framework is the foundation that turns an AI PoC into a **reliable, multi-tenant, auditable operation**. Nine building blocks that are vertical-independent and make the difference regardless of the specific use case:

Building block	What it delivers
ERP / CRM / PIM Integration	Production-proven connectors to Business Central, SAP (incl. IDoc), industry ERPs, CRM and PIM systems. Bidirectional data flows, no silos. New target systems can be added without reworking the framework.
Multi-tenant Runtime & Deployment	One image, one container per tenant. Production-proven — including hardened setup in third-party Azure environments.
Plugin Architecture	Customer-specific logic is embedded as an isolated plugin — without touching the core. Fault-tolerant and cleanly versioned.
Tenant Configuration & Secret Management	Encrypted configuration per tenant, optionally with Azure Key Vault. Credentials never in code, never in the image.
State Machine & Human-in-the-Loop	Every transaction is traceable — Submitted, Working, Completed, Failed, HITL. Resume exactly where it broke after a crash. Structured review instead of inbox chaos.
Dialog Agent Pattern	Autonomous AI exactly where it belongs — at the human-dialog boundary. Never on safety-critical transactions. A pattern reusable for virtually any AI agent that needs to ask clarifying questions.
Admin Server & Role Model	Three server modes (Full / Control Plane / Tenant), roles and permissions, CLI for operations.
Governed Learning	Rule engine, teach-test-confirm, layered memory

Building block	What it delivers
	(episodic, semantic, procedural). AI learns — but in a controlled and traceable way.
Pluggable Connectors	Email, LLM, database, file download — all selectable via configuration, not through code forks. No vendor lock-in.

What this means in practice: You don't have to invent multi-tenancy, HITL workflows, secret management, audit trails, container deployment, dialog patterns, or **deep integration with your target systems (ERP, CRM, PIM)**. These production-proven building blocks are available from day one. Your investment flows into what actually creates value for you — the part of the solution tailored to your process.

METHODOLOGY

How we work.

Our approach follows the same principle as our agent projects: **bottom-up, not top-down**. Small, productive MVPs — from which organic growth emerges. No six-month strategy exercises, no PowerPoint marathons.

Five steps from discovery to production

1 • Discovery *30 minutes*

Initial call, no commitment. We listen, understand your situation — and give an honest first assessment of whether and where automation makes sense.

2 • Workshop *1–2 days*

Structured workshop to jointly identify and prioritize use cases. Which process delivers the fastest, most measurable value? Which target systems (ERP, CRM, PIM) need to be connected?

3 • Pilot (MVP) *4–8 weeks*

Tailored MVP for the prioritized use case. Built on our framework — including production integration with your existing target systems — with customer-specific logic as an isolated plugin.

4 • Proposal *transparent*

Detailed proposal with all integration and operations costs. Optionally with savings-sharing.

5 • Production *ongoing*

Support from go-live to continuous optimization. Monitoring, development, adaptation to new AI standards.

Direct value creation in production processes. Project timelines under 90 days. Measurable impact from the first month.

What you get from us

- **Industrial foundation** instead of hand-crafted PoC infrastructure
- **Production-proven integrations** with your ERP, CRM and PIM landscape — not just concepts
- **Production-proven patterns** for HITL, multi-tenancy, audit, monitoring
- **Cost-efficient extensibility** — additional processes without new base integration

- **Sustainable operations** with continuous adaptation to new AI standards
- **Transparency** on costs, timelines and risks — honest, even when a project isn't worth doing

WHO THIS OFFERING IS FOR

Mid-sized companies with AI ambition.

Our extended offering is for mid-sized companies in the DACH region that:

- have already run first AI experiments or PoCs in-house
- are hitting the limits of standard SaaS tools for their specific processes
- need a tailored solution — but **don't want to run the infrastructure themselves**
- want an AI solution deeply integrated into their existing **ERP, CRM or PIM landscape**
- are looking for a reliable partnership beyond the PoC — in development, operations and evolution

Let's talk.

30 minutes are enough to see whether a meaningful entry point exists for your processes — or whether it isn't worth it. **We'll say both honestly.** No sales show, no commitment.
